This description is for species *phlox* (*Phlox divaricata* subsp. *Laphamii*):

Phlox divaricata subsp. *Laphamii* is commonly known as wild sweet William and produces clusters of gorgeous purple-blue flowers that offer a subtle fragrance. Wild sweet William should be planted in partially shaded or full shade areas. It can be grown in chalky, sandy, loamy or clay soil that offers good drainage. The soil should be kept moist and an added layer of mulch is appreciated by this plant as well. Wild sweet William makes for very pretty underplanting and is sure to draw the eye within flower borders and beds. This beautiful plant looks spectacular in woodland gardens and is also a bold means of adding colour to rock gardens as long as it is kept in the shadier parts.
